Everything you wanted to know about the General Self-Efficacy Scale but were afraid to ask

by Ralf Schwarzer, January 5, 2009

The purpose of this FAQ is to assist the users of the scales published at the author's web pages http://www.ralfschwarzer.de/

DOWNLOAD of PDFs: http://userpage.fu-berlin.de/~health/self/selfeff_public.htm

Before attending to the questions below you might want to study our web pages. You might not have any questions after reading the web pages.

 водо Do I need permission to use the general perceived self-efficacy (GSE) scale?

You do not need our explicit permission to utilize the scale in your research studies. We hereby grant you permission to use and reproduce the General Self-Efficacy Scale for your study, given that appropriate recognition of the source of the scale is made in the write-up of your study.

The international source is:

The source for the German version is:

 водо I am not sure whether I want to measure general perceived self-efficacy (GSE) or specific health-related self-efficacy.

You have to decide which one fits your research question. If you intend to predict a particular behavior you are better off with a specific scale. You might be best off by designing your own items, tailored to your study, such as:
"I am certain that I can do ...xy..., even if ...zz ..." ( 1    2    3     4 ).

Health-specific self-efficacy scales can be found at:
http://userpage.fu-berlin.de/~health/healself.pdf

For the English version of the teacher self-efficacy scale, see Schwarzer & Hallum (2008).

If you are interested in other health behavior constructs, consult the NCI Health Behavior Constructs Website:
What is the scoring procedure for the GSE?

Add up all responses to a sum score. The range is from 10 to 40 points. Or use a mean score, such as:

\[
\text{COMPUTE SEFF} = \text{Mean} (\text{SE1}, \text{SE2}, \text{SE3}, \text{SE4}, \text{SE5}, \text{SE6}, \text{SE7}, \text{SE8}, \text{SE9}, \text{SE10}).
\]

In many samples the mean had been around 2.9

Occasionally, someone will not respond to some of the items. What do you recommend to do with missing data?

Our rule of thumb is to calculate a score as long as no more than three items on the ten-item scale are missing.

In SPSS, this is done by:

\[
\text{COMPUTE SEFF} = \text{Mean.7} (\text{SE1}, \text{SE2}, \text{SE3}, \text{SE4}, \text{SE5}, \text{SE6}, \text{SE7}, \text{SE8}, \text{SE9}, \text{SE10}).
\]

However, there are also other methods such as regression, hot deck, or multiple imputations techniques (ask your advisor).

How can I categorize persons as being high or low self-efficacious?

We do not endorse the view that people should be categorized this way. There is no cut-off score. One could, however, establish groups on the basis of the empirical distributions of a particular reference population. One could do a median split, which is to dichotomize the sample, for example, at the cut-off point of 30 (if this is near the median in your sample).

Can I use some original data to compare with my own data?

Yes, there is an international data set as an SPSS SAV file that includes about 18,000 respondents. Available for free download at:

http://www_fu-berlin_de/gesund/gesu_engl/world_zip.htm

What are the psychometric characteristics of the GSE?

It depends on the sample and the study context. There are more than 1,000 studies that have used the scales in many countries and languages

There are currently scale versions adapted to 30 languages. See:

http://userpage.fu-berlin.de/~health/selfscal.htm

Updated psychometric findings have been published recently, for example, in:

Can you tell me more about the validity of the GSE?

</tr>
</tbody>
</table>

**Note.** The correlations were derived from a sample of East German migrants in 1989 and 1991.

n = 528 men and n = 380 women took part in the first wave of data collection, n = 122 men and n = 102 women participated also at the second point in time.

</table>

**Note.** The correlations were derived from a sample of N = 180 university students. All correlations are highly significant.

What are the norms of the GSE?

<table>
<thead>
<tr>
<th>T-Norms of the General Perceived Self-Efficacy Scale</th>
</tr>
</thead>
</table>

Heterogenous Adult Population: The T-norms for the German version of this scale are based on a sample of N = 1,660 persons. The weighted mean was found to be 29.28, the weighted variance equalled 25.91.

High School Students: These T-norms were derived from a sample of N = 3,494 German high school students (12 to 17 years old). In this sample the mean was found to be 29.60, standard deviation equalled 4.0.

US-American Adult Population: These T-norms were derived from a sample of N = 1,594 US-American adults. In this sample the mean was found to be 29.48, standard deviation equalled 5.13. Gender was equally distributed, male 50.9%, female 49.1%.
Where can I read more about the scale and the research that has been conducted with it?

We wish you much success with your research.

If you still have questions, you may send an e-mail to Ralf Schwarzer at health@zedat.fu-berlin.de
